

CoolPeople v3 / WouldBe — Reconciled Build Status

Single source of truth. This reconciles three drifting inputs into one current picture:

Input	Date	Role here
CoolPeople_API_Routes_and_DB_Functions_MASTER.pdf	Jun 1	Full scope map (§1–§17). Its build-status markers are stale .
CoolPeople_Remaining_Tables_and_Files_S4–S6.pdf	Jun 5	Newer; adds the Debate Update layer (Twitch, sponsor economics, payouts) MASTER lacks.
The repo (coolpeoplev3-backend)	today	Ground truth — what's actually built. Ahead of both PDFs.

Generated by scanning the repo: **12 migrations, 35 route files, 38 DB modules.**

Legend:  built & routed ·  partial ·  todo

At a glance

§	Area	Status	Notes
—	Schema / migrations		All 12 migrations applied, through 1780800000000 .
1	Auth & Users		incl. password-reset, email/phone verify, refresh, searchUsers , prompts, push subs
2	Consent / Attestation / Privacy		incl. data-sale gate, push transport, isPledgeEligible
3	Political Reference Data		offices, politicians, races, deadlines, election-calendar engine, filing authorities, user-jurisdictions
4	FEC / Election-Law Compliance		committees, compliance checks, jurisdiction rules, testing-the-waters, fundraising eligibility
5	WouldBe / Plans / Pledges / Follows		incl. staged gating, goals, pledge cap/reset (4 small gaps below)
6	Sponsors, Debates, Rules, Criteria, Judges		none built
7	Debate Entry, Prompts, Contestants, Voting		none (note: the built prompts.js is the user soft-ask log, not debate prompts)
8	Posts, Endorsements, Comments, Nominations		none built
9	Debate Results, Prize Pool, Payouts, Contest Compliance		none built
10	Content Moderation		tables exist; no fns/routes
11	Trust & Safety		tables exist; rateLimit middleware exists (in-memory)
12	Messaging		none built
13	Payments (Stripe)		WouldBe \$5 creation fee recording built; tips/entry/subscription/webhooks todo

§	Area	Status	Notes
14	Financial Audit + Tax	■	none built
15	Admin & Operational	●	admin-user CRUD + recordAdminAction + change-reports built; system-jobs/admin-action queries todo
16	Internal / Webhooks	●	only the age-band cron runs; calendar-sync / link-health / stage-gate crons + webhooks todo
17	Notifications (candidate notifier)	■	tables exist; engine + criteria versions todo
DU	Debate Update layer	●	WouldBe creation-fee + processor link built; Twitch / sponsor economics / payouts todo

Bottom line: §1–§5 (the entire civic + compliance + campaign core) are **built and routed**. §6–§17 are largely greenfield, except partial Admin/Payments/Internal and the WouldBe-side of the Debate Update.

Corrections vs. the MASTER PDF (things it marks "todo" that are now BUILT)

The MASTER (Jun 1) predates most of the route-wiring and all of §4–§5. These are **done** in the repo:

- **Auth:** createPasswordResetToken, resetPasswordWithToken, markEmailVerified, setPhoneVerificationCode, markPhoneVerified, verifyRefreshToken — built (migration 1780300000000).
- **Users:** searchUsers, updateUserLastLogin (session-count) — built.
- **Geo:** setUserJurisdictionsFromGeocode + the full user-jurisdictions resolver — built.
- **Prompts:** recordPromptResponse, getDuePrompts — built.
- **Consent:** data-sale gate (isUserSellable, listSellableUsers, hasOptedOutOfSale, recordSaleOptOut, getUserSaleStatus) + push transport (savePushSubscription, revokePushSubscription, getActivePushTargets) — built.
- **Attestation/Pledge:** isPledgeEligible — built (in pledges.js).
- **§3 entirely:** offices (incl. getOfficeEligibility, getQualifyingOffices), politicians, races, election-deadlines, the **election-calendar/offset engine** (getAnchors / upsertElectionAnchor / getOffsetRules / upsertOffsetRule / computeDeadlinesForOffice), filing-authorities, user-jurisdictions — all built and routed.
- **§4 and §5 entirely** — built and routed (this work).

Detail by section

✓ §1 — Auth & Users

- **Routes:** authRoutes.js, userRoutes.js.
- **auth.js:** authenticate, findUserByToken, signAccessToken, signRefreshToken, verifyRefreshToken, createPasswordResetToken, resetPasswordWithToken, markEmailVerified, setPhoneVerificationCode, markPhoneVerified.
- **users.js:** createUsers, searchUsers, fetchUserById, fetchPublicUserById, getUserByEmail, fetchIdByEmail, fetchUsernameById, updateUser, deactivateUser, getCurrentUserWouldbes,

getAllUserWouldbes, getUserCurrentDebates, getUserEndorsementHistory, updateUserLastLogin, deriveAgeBand.

- **prompts.js** : recordPromptResponse, getDuePrompts.
- **pushSubscriptions.js** : savePushSubscription, revokePushSubscription, getActivePushTargets.

✓ §2 — Consent / Attestation / Privacy

- **Routes**: consentRoutes, attestationRoutes, childSafetyRoutes, dataRightsRoutes, dataRetentionsRoutes, piiAccessRoutes, legalDocRoutes.
- **DB**: consent.js (incl. data-sale gate), attestation.js, childSafety.js, dataRights.js (DSR + R2 export), dataRetentions.js, PIIAccess.js, legalDocs.js.

✓ §3 — Political Reference Data

- **Routes**: jurisdictionsRoutes, officesRoutes, politiciansRoutes, racesRoutes, electionDeadlinesRoutes, electionCalendarRoutes, filingAuthoritiesRoutes, userJurisdictionsRoutes.
- **DB**: jurisdictions.js, offices.js, politicians.js, races.js, electionDeadline.js, electionCalendar.js, filingAuthorities.js, userJurisdictions.js.

✓ §4 — FEC / Election-Law Compliance Gates

- **Routes**: candidateCommitteesRoutes, complianceChecksRoutes, jurisdictionRulesRoutes, testingTheWatersRoutes, fundraisingEligibilityRoutes.
- **DB**: candidateCommittees.js (createCandidateCommittee, verifyCommitteeViaAPI→confirmCommittee, hasActiveVerifiedCommittee — the launch gate, accepts provisional_on_receipt), complianceChecks.js, jurisdictionRules.js, testingTheWaters.js, fundraisingEligibility.js.
- **Known stub**: verifyCommitteeViaAPI confirms from a supplied payload; the **live FEC/state API client is not built** (marked [TODO/INFRA] in code).

✓ §5 — WouldBe / Plans / Pledges / Follows

- **Routes**: wouldbeRoutes, plansRoutes, planTimelineRoutes, goalsRoutes, pledgesRoutes, followsRoutes, stageProofsRoutes.
- **DB**: wouldbe.js (+ Debate-Update creation-fee/processor helpers + recommendations/counters), plans.js, planTimeline.js (timeline CRUD + buildStagedTimeline + evaluateStageGate + audit), stageProofs.js, goals.js, pledges.js (cap/reset, eligibility, stage attribution), follows.js.
- **4 small gaps still open**:
- getRecommendedWouldbes is a simple jurisdiction match — MASTER wants the **notifier-twin** using shared objective criteria (notification_criteria_versions, 11 CFR 110.13). *Blocked on §17*.
- getGateAuditTrail is keyed by componentId; MASTER also wants a per-WouldBe (wouldbeId) fairness audit.
- getStage(componentId) / listStagesForWouldbe(wouldbeId) named in MASTER not yet added (we have getStagedTimeline(planTimelineId)).
- markPledgesGoalReached returns an event marker but emits no real notification — deferred until §17 exists.

● §13 — Payments

- Built: WouldBe **\$5 creation-fee** recording + processor link (recordWouldbeCreationPayment, getWouldbeCreationPayment, setContributionProcessor, recordGoalReached in wouldbe.js).

- Todo: tips, post-payments, subscriptions, debate-entry payments, Stripe webhook handlers.

● §15 — Admin & Operational

- Built: `admins.js` (`listAdmins`, `getAdminById`, `createAdmin`, `updateAdmin`, `terminateAdmin`) + `adminRoutes.js` (super-admin-gated CRUD) + `recordAdminAction` middleware + `changeReports.js` (report-a-change queue).
- Todo: `systemJobs` CRUD, admin-action query endpoints, PII-access grant/revoke routes.

● §16 — Internal / Webhooks

- Built: `scheduledJobs.js` runs the **age-band refresh** cron (03:00 ET).
- Todo: `election_calendar_sync`, `authority_link_health`, `stage_gate_evaluate` crons (some DB fns exist, no scheduler), notifier run, and all external webhook handlers (Hive/OpenAI/PhotoDNA/Cloudflare/R2/Stripe/Twitch).

■ §6–§12, §14, §17 — not built

Sponsors/Debates/Rules/Criteria/Judges (§6); Debate Entry/Contestants/Voting (§7); Posts/Endorsements/Comments/Nominations/Recommendations (§8); Results/Prize-Pool/Payouts/Contest-Compliance (§9); Content Moderation (§10); Trust & Safety (§11); Messaging (§12); Financial Audit + Tax (§14); Notifications engine (§17). **Schema/tables for these are migrated; functions and routes are not.**

● Debate Update layer (from the S4–S6 PDF — absent from MASTER)

- Built: WouldBe-side creation fee + ActBlue/WinRed processor link.
- Todo: debate sponsor flat-fee + entry economics (`debate_payments`), sponsor payouts from entries, the **Twitch livestream subsystem** (`twitch_connections`, `debate_streams`, `EventSub`, recordings, participant consents). All need external clients (Stripe, Twitch OAuth/EventSub, R2) → will be honest stubs.

Biggest remaining chunks (suggested priority)

1. **§6 Debates + Debate Update economics** — the other half of the product; depends on Sponsors (§6) + payments (§13) + Twitch (§16). Highest surface area.
2. **§8 Posts/Endorsements/Comments** — core social loop; needs media upload (R2 presigned).
3. **§17 Notifications engine** — unblocks the real `getRecommendedWouldbes` scorer and the `*_reached` emissions already stubbed in §5.
4. **§13 Payments (Stripe) + §14 Tax** — real-money surfaces (tips, debate fees/markup, payouts, 1099/1042-S).
5. **§10–§11 Moderation + Trust & Safety** — required before public content.
6. **§16 crons/webhooks** — wire the calendar-sync / link-health / stage-gate jobs the DB layer already supports.

Money model (confirmed): the platform never touches campaign contributions (pledges are promises only). Platform revenue = tips + debate-poster flat fee + a per-transaction markup on debate transactions.
